Inequalities in Obesity & Excess Weight in Childhood

NCMP: Kent – 2017/18 update

In Kent, there are differences evident in levels of excess weight in childhood by sex, deprivation, ethnicity and rurality in both Year R and Year 6. Inequalities are particularly marked by ethnicity and deprivation.
In Year 6, boys in Kent are slightly more likely to be obese than girls. The gap is largest for obesity in Year 6. The evidence suggests that the gap has remained relatively constant over the last 9 years.
In both Year R and Year 6, children living in the most deprived areas in Kent are more likely to be obese than those living in the least deprived areas.

The gap is largest for obesity in Year 6, and there is evidence to suggest that the gap is increasing.

**Year 6 Obesity**

- **2017/18**
- **26%** of the most deprived pupils
- **12%** of the least deprived pupils

---

**Inequalities in Obesity Prevalence: Over Time**

- **2008/09** to **2017/18**
- **6.6%** increase in obesity for Least Deprived
- **7.1%** increase in obesity for Most Deprived

**Childhood Weight: By Deprivation**

- **2017/18**
- **41%** Excess weight for Most Deprived
- **26%** Excess weight for Least Deprived

---

Inequalities in Obesity & Excess Weight in Childhood, October 2018
In Year 6, children of Black or Asian ethnic origin are more likely to be obese than their white classmates.

The gap is largest for obesity in Year 6.

There are known associations between ethnicity and area deprivation. Deprived urban areas in England tend to also have a higher proportion of individuals from non-White ethnic groups, so it is likely that there are confounding factors which affect obesity prevalence by ethnic group.
In both Year R and Year 6, children living in urban areas are slightly more likely to be obese than those living in rural areas.

The PHE Obesity K&I’s reports in 2006/07 and 2007/08 show that confounding factors exist, and that variation in child obesity prevalence between urban and rural areas can possibly be explained by differences in the degree of deprivation and the ethnic mix in such areas.

Conclusions

• Within Kent there are significant inequalities in excess weight in childhood, particularly with regard to deprivation and ethnicity

• These inequalities are driven by inequalities in obesity

• Inequalities in obesity are particularly marked in Year 6 pupils

• In the case of deprivation, there is clear evidence to suggest that the inequality gap is widening, particularly by Year 6

• The gap between the most and least deprived Year 6 pupils in Kent has shown a large increase...
  • ...from 6.6 percentage points in 2008/09 to 14.1 percentage points in 2017/18
The National Child Measurement Programme (NCMP) records height and weight measurements of children in reception (aged 4–5 years) and year 6 (aged 10–11 years) in state-maintained schools in England.

The data presented in this report is based on analysis of the pupil-level datasets supplied to Kent by NHS Digital. Previous years is based on final data.

The Kent analysis is based on pupils measured under the NCMP programme who

- Attend a mainstream (Kent) state school (special schools are excluded)
- Live in Kent

Differences referred to in the commentary are statistically significant at the 95% level. Confidence intervals have been calculated using the Wilson method advocated nationally.

Deprivation has been measured via the Index of Multiple Deprivation (IMD). The Kent results are based on the local population weighted deciles derived from IMD 2015.

Inequality gaps are measured as the distance between the actual data points (and not from the best fit line).
