

South Kent Coast CCG and Dover and Shepway Local Authorities

- Alcohol & Liver Disease Profile

Indicators at ward level include:

- Emergency admission rates due to alcohol-specific conditions
- Emergency admission rates due to alcoholic liver disease
- Mortality rates for alcoholic liver disease

Indicators at a CCG/ Local Authority level include:

- Emergency admission rates due to alcohol-specific conditions
- All alcohol-specific admissions split by the number of individuals involved in the total number of admissions for that year
- Alcohol related* mortality
- Alcohol related* hospital admissions
- Mortality from chronic liver disease

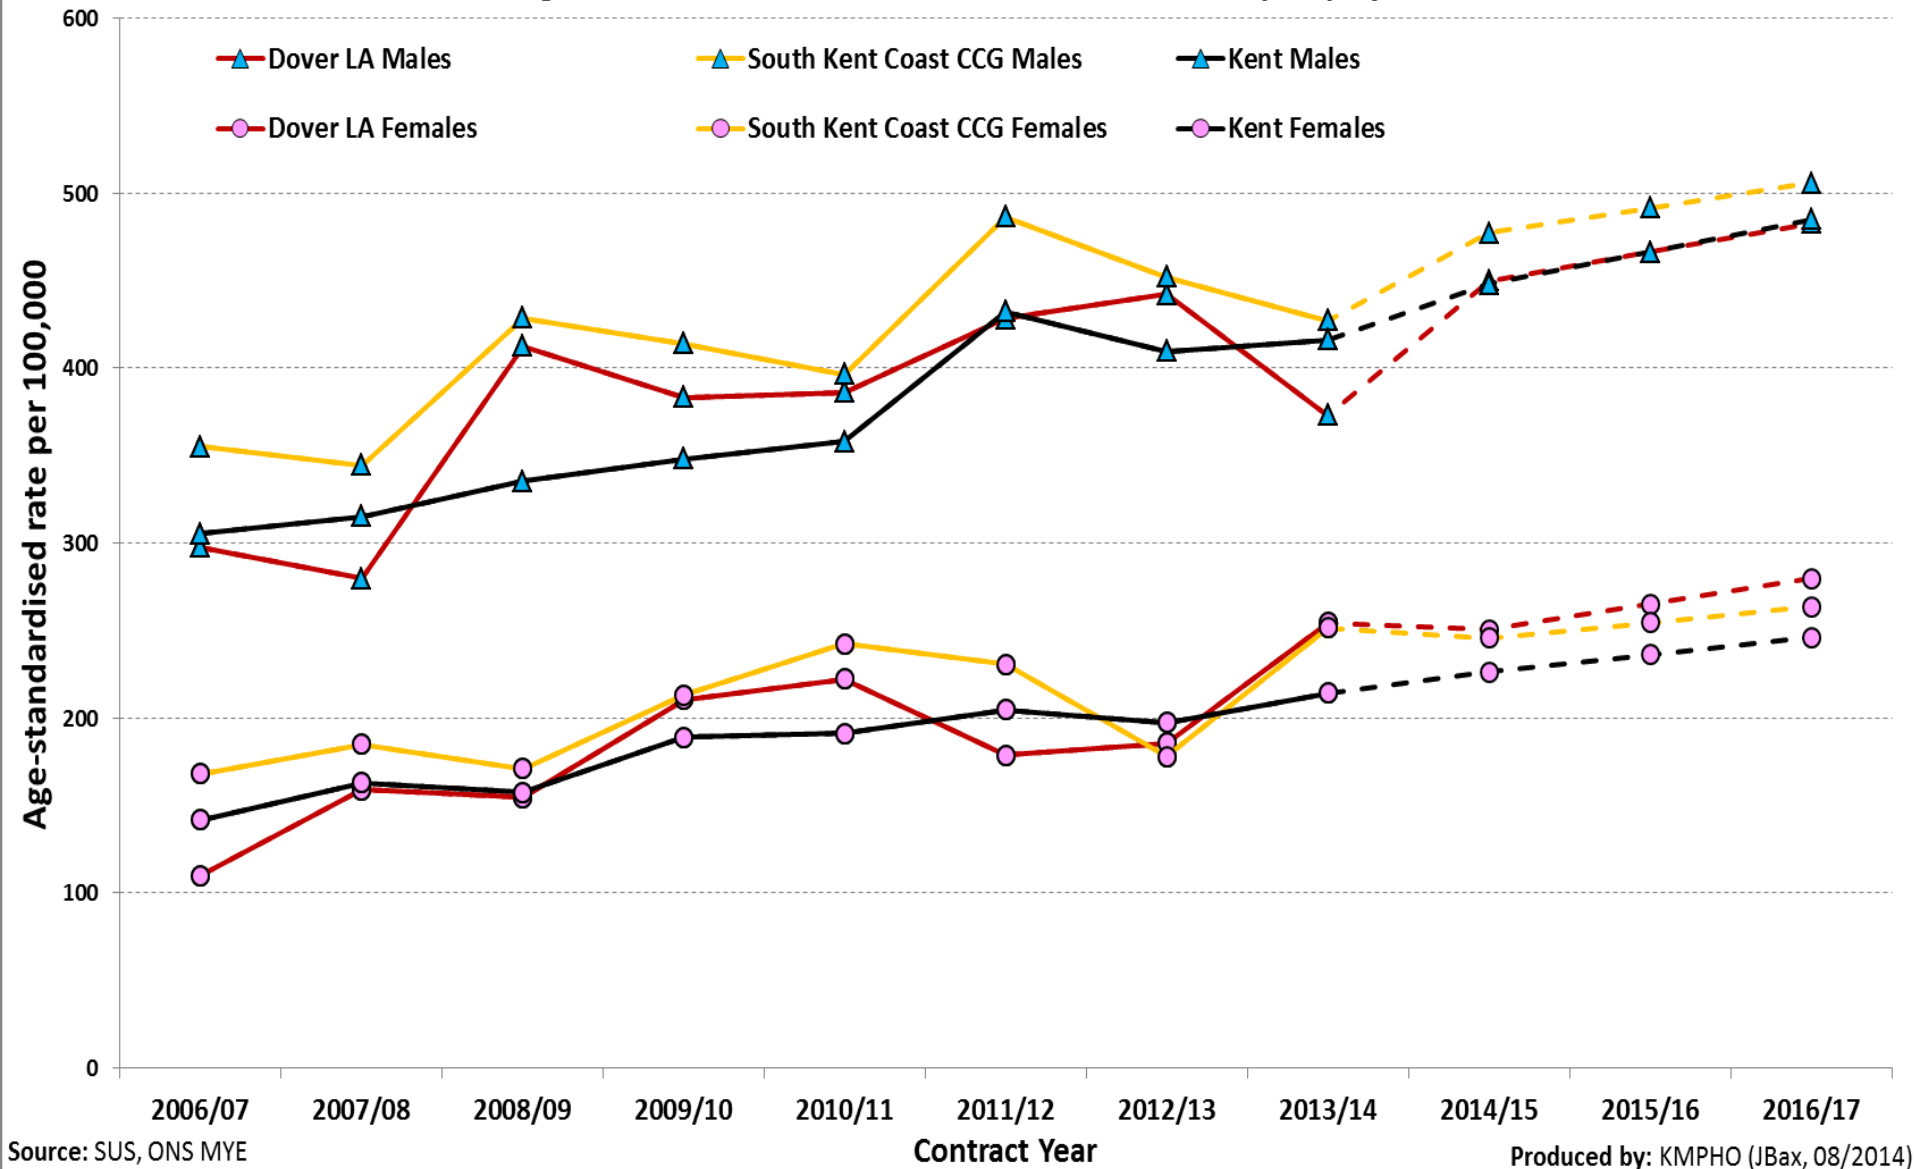

*alcohol related admissions are published in the Local Alcohol Profiles for England (LAPE) and use alcohol attributable fractions to calculate the number of hospital admissions which could be related to alcohol. (for example, 27% of assaults are estimated to be alcohol-related and therefore the alcohol-attributable fraction is 0.27).

For a better understanding of how these are calculated please visit:

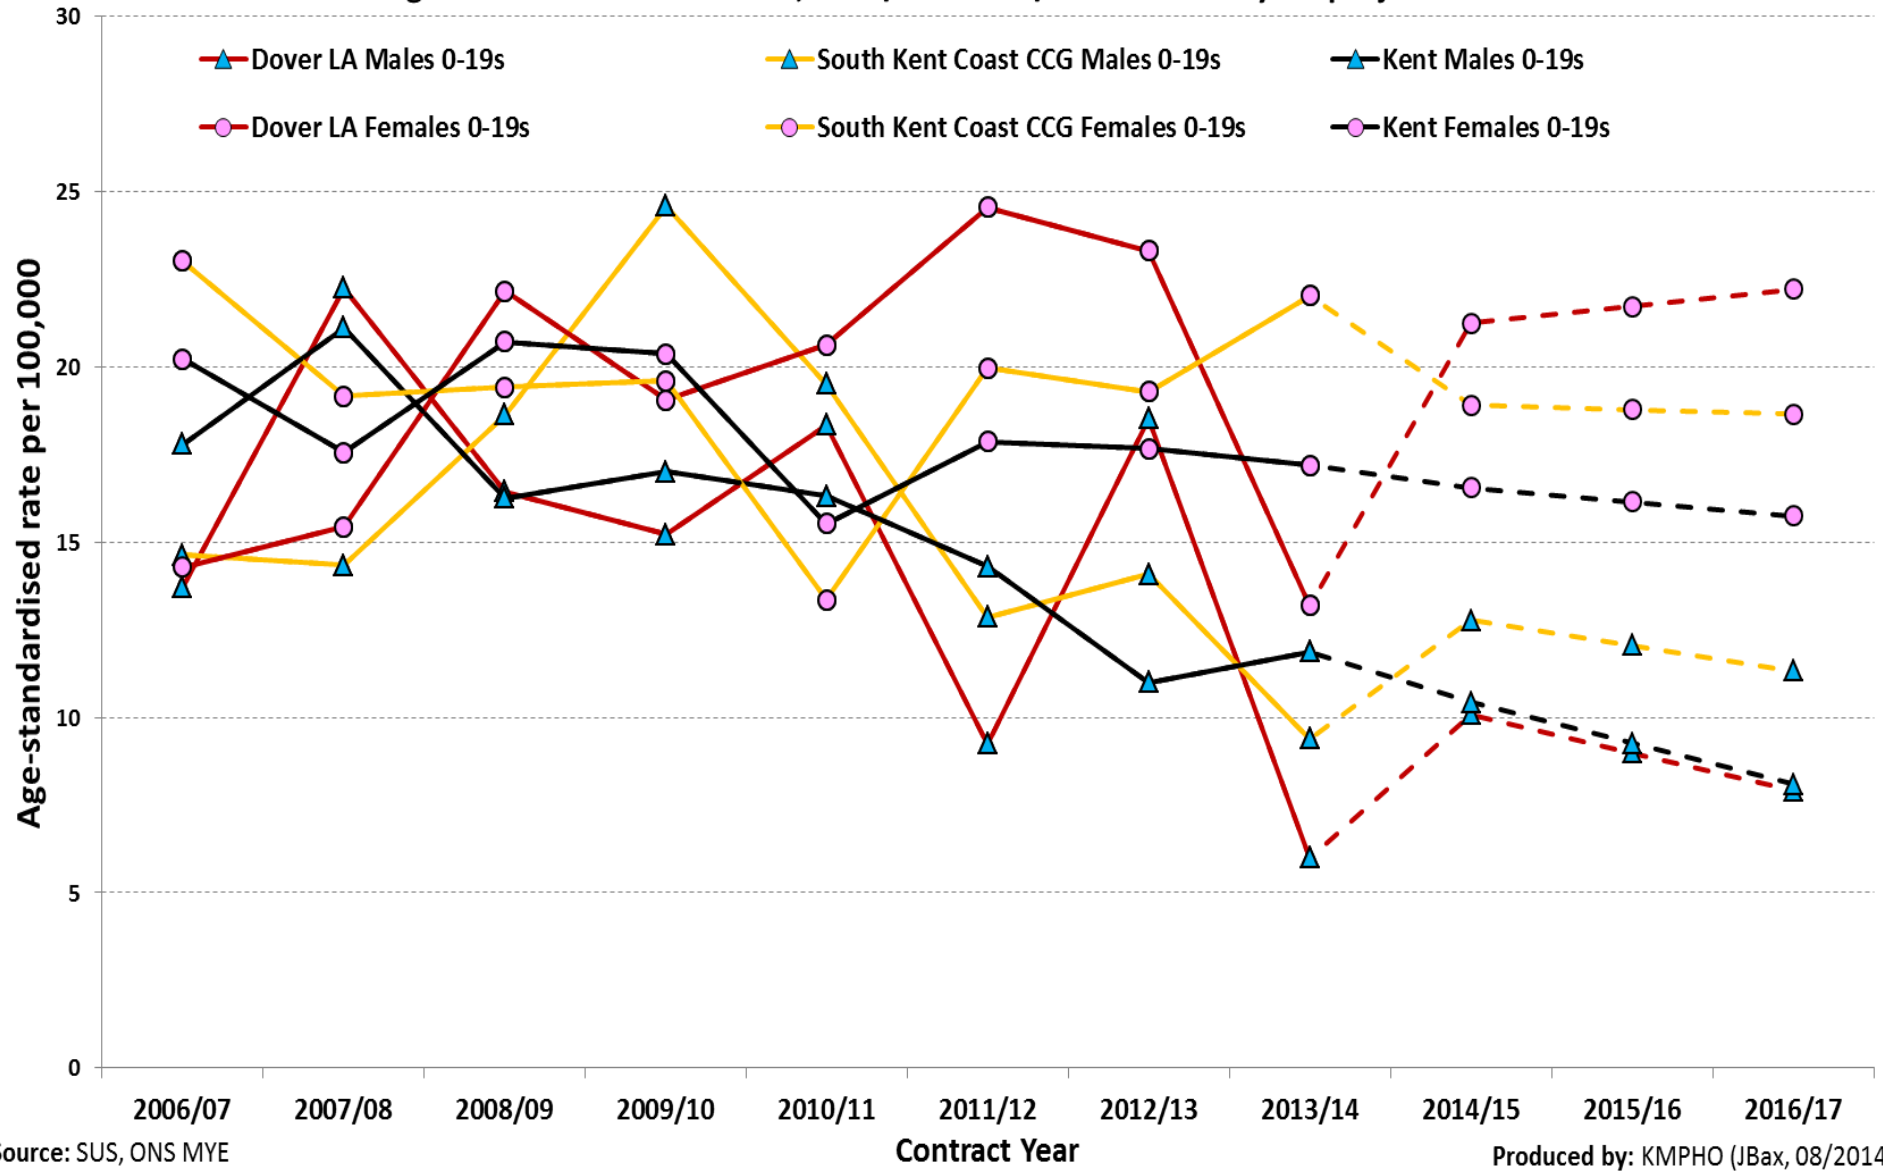

<https://publichealthmatters.blog.gov.uk/2014/01/15/understanding-alcohol-related-hospital-admissions/>

or alternatively visit the LAPE homepage; <http://www.lape.org.uk/index.html>
